EXPERIMENT - 1: ADDITION

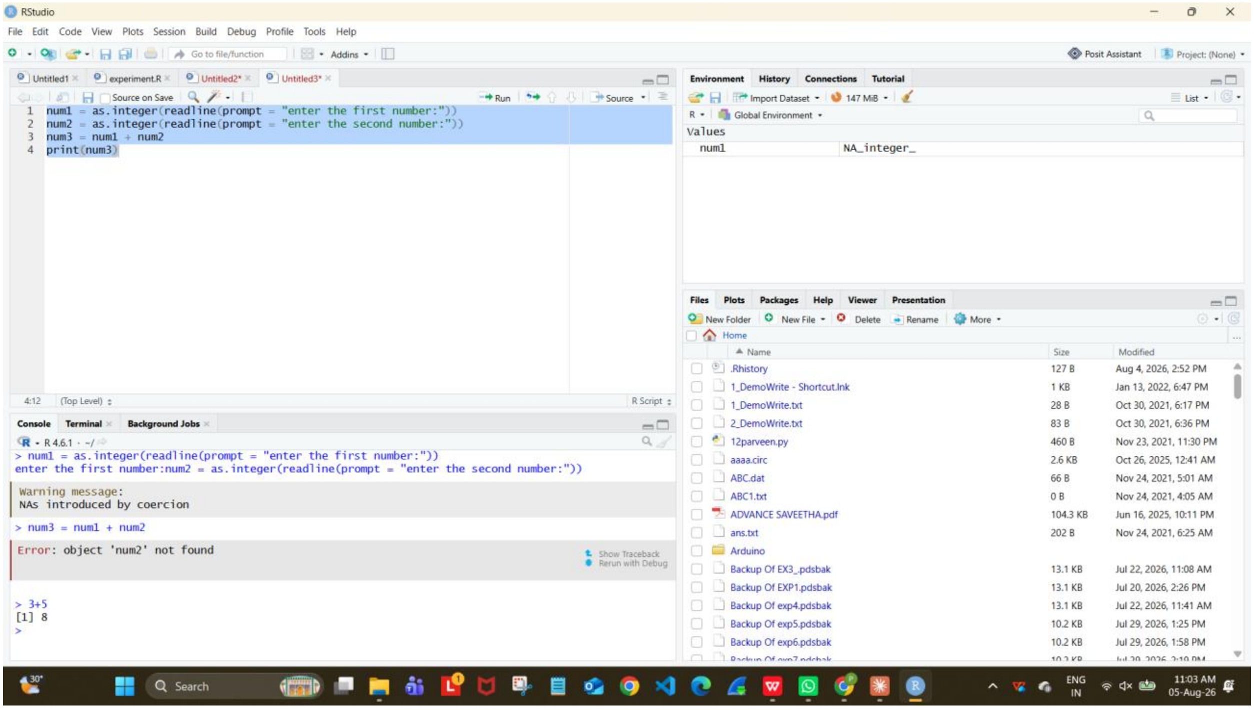
AIM:

To write/prove the R program for addition using RStudio.

PROGRAM:

```
num1 = as.integer(readline(prompt = "enter the first number:"))
num2 = as.integer(readline(prompt = "enter the second number:"))
num3 = num1 + num2
print(num3)
```

OUTPUT:



RESULT: Thus the R program for addition was executed successfully.

EXPERIMENT - 2: SUBTRACTION

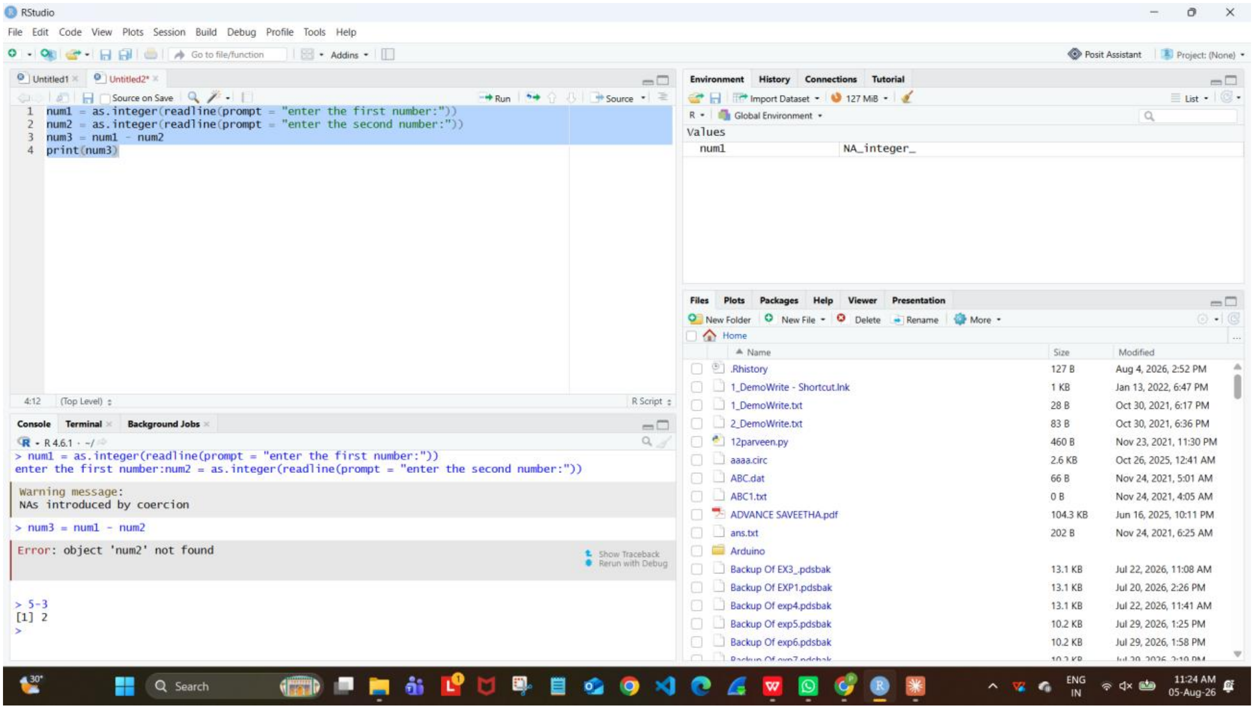
AIM:

To write/prove the R program for subtraction using RStudio.

PROGRAM:

```
num1 = as.integer(readline(prompt = "enter the first number:"))
num2 = as.integer(readline(prompt = "enter the second number:"))
num3 = num1 - num2
print(num3)
```

OUTPUT:



RESULT: Thus the R program for subtraction was executed successfully.

EXPERIMENT - 3: MULTIPLICATION

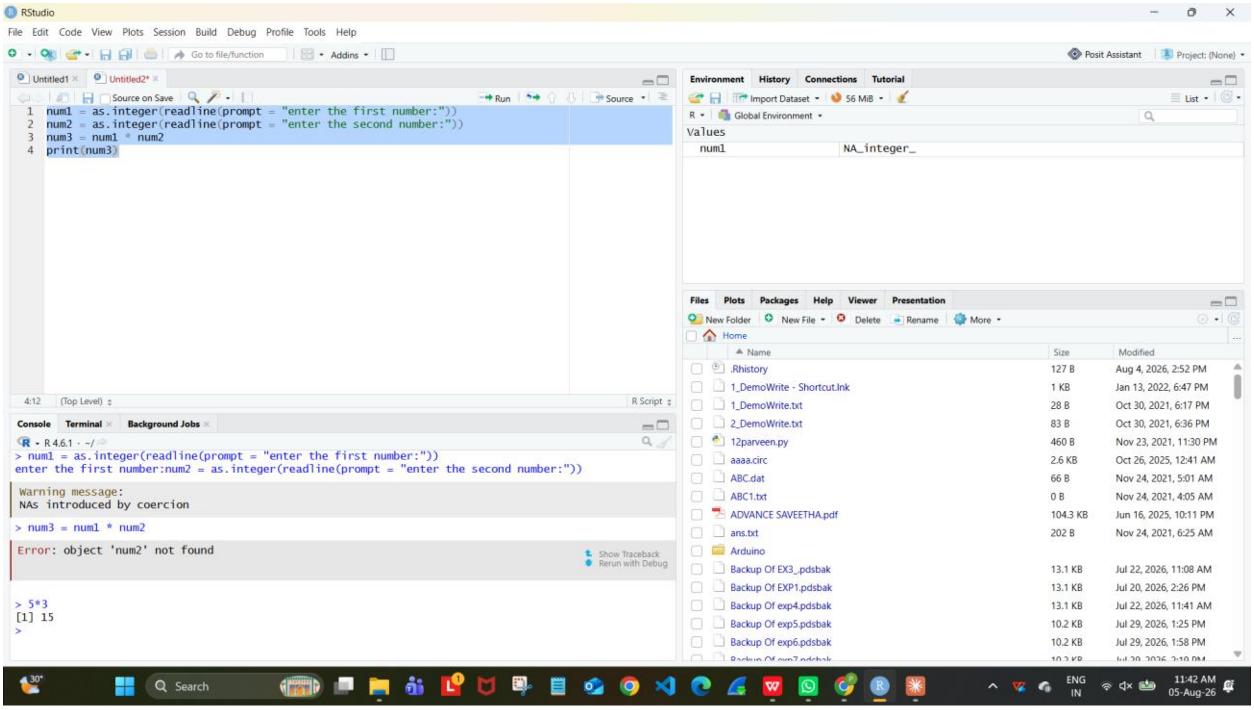
AIM:

To write/prove the R program for multiplication using RStudio.

PROGRAM:

```
num1 = as.integer(readline(prompt = "enter the first number:"))
num2 = as.integer(readline(prompt = "enter the second number:"))
num3 = num1 * num2
print(num3)
```

OUTPUT:



RESULT: Thus the R program for multiplication was executed successfully.

EXPERIMENT - 4: DIVISION

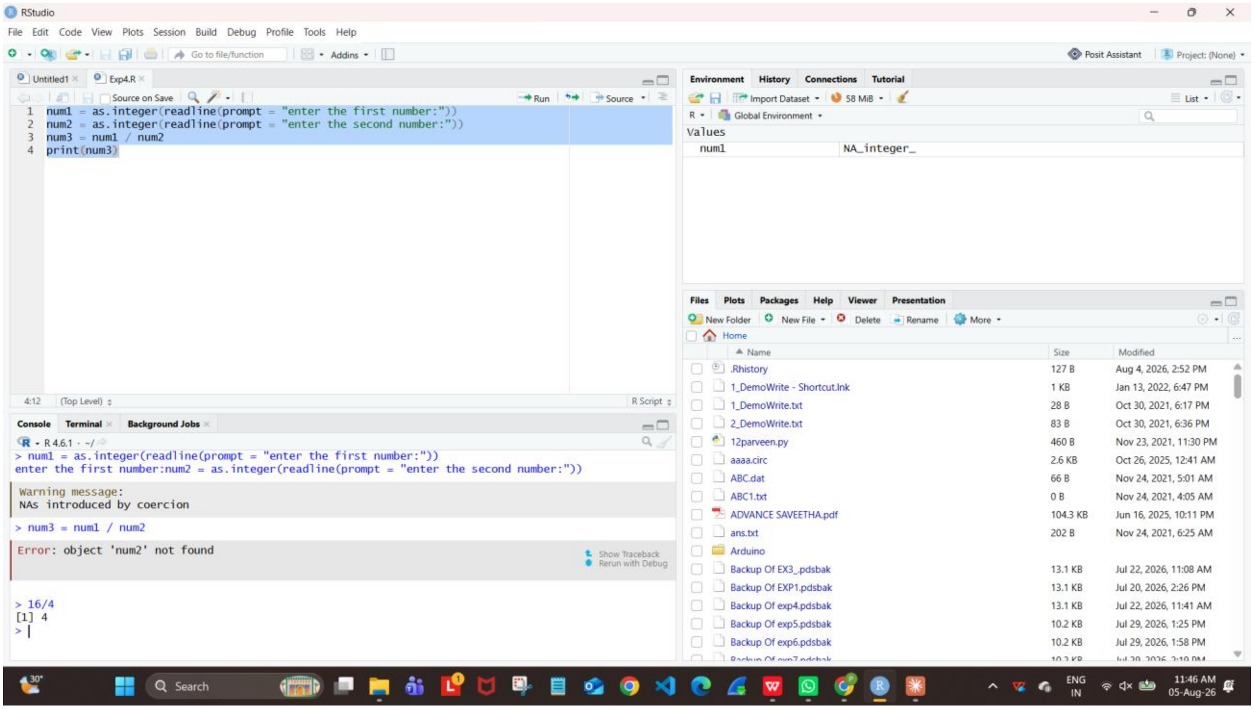
AIM:

To write/prove the R program for division using RStudio.

PROGRAM:

```
num1 = as.integer(readline(prompt = "enter the first number:"))
num2 = as.integer(readline(prompt = "enter the second number:"))
num3 = num1 / num2
print(num3)
```

OUTPUT:



RESULT: Thus the R program for division was executed successfully.

EXPERIMENT - 5: ODD OR EVEN

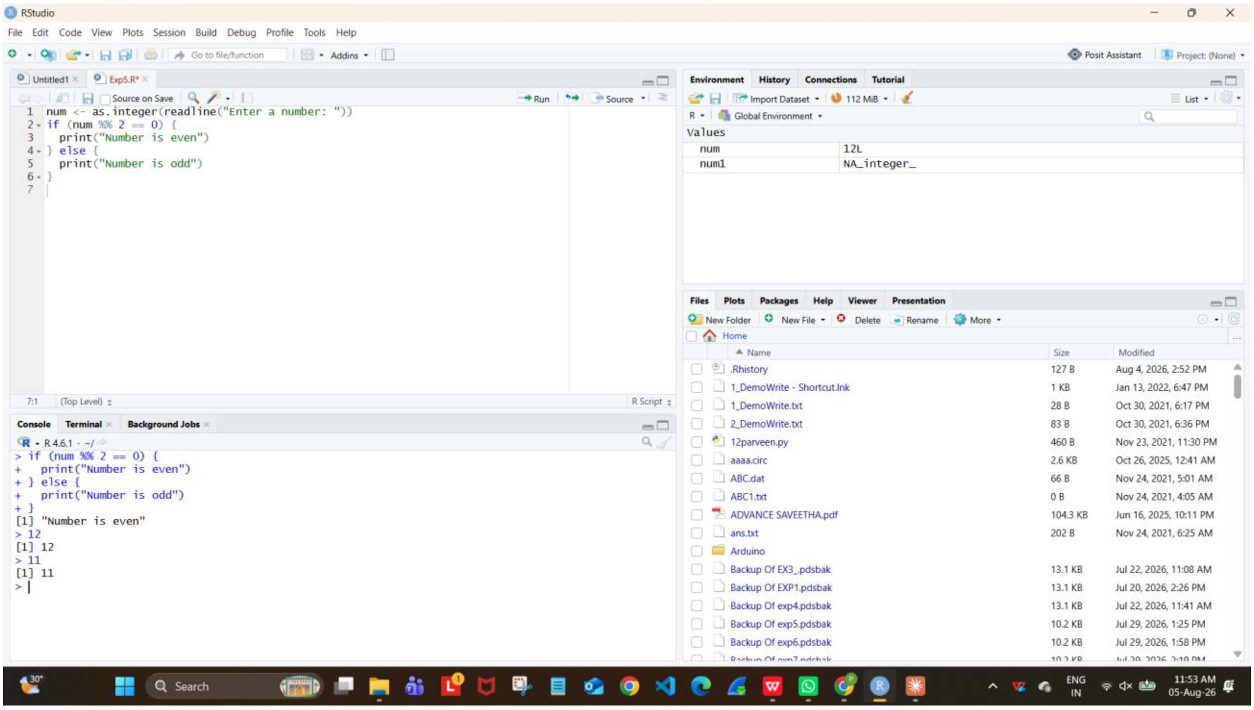
AIM:

To write/prove the R program for odd or even using RStudio.

PROGRAM:

```
num = as.integer(readline(prompt = "enter a number:"))
if ((num %% 2) == 0) {
  print("number is even")
} else {
  print("number is odd")
}
```

OUTPUT:



RESULT: Thus the R program to check odd or even was executed successfully.
